Summary

Full-stack developer building AI-native products: LLM agents with tool calling, RAG pipelines, and the web applications and backend services around them. Strong in TypeScript, React, Next.js, and Python (FastAPI), shipping end to end from frontend to self-managed infrastructure.

Experience

Independent Web Developer, LimassolWeb – Limassol, Cyprus — Sept 2024 – present

- Independent web development work for clients in Limassol on a project basis, alongside personal product work. Sites built with Next.js, Astro, TypeScript, and Tailwind, deployed on Vercel and Cloudflare.

Software Developer, Panaline – Limassol, Cyprus — Aug 2023 – June 2024

- Built an internal financial analysis tool in Python and Streamlit for expense tracking and allocation.
- Automated data ingestion and expense allocation logic, reducing manual processing time on recurring reports.

Projects

Klio — Sept 2025 – present

- AI WhatsApp assistant for Cyprus real estate agents, live at kliohq.com with a public demo. A tool-using Claude agent (nine tools via the Vercel AI SDK) answers buyers from the agent's listings, qualifies budget, area and timeline into a lead score, books viewings the agent approves, and hands over to a human when needed.
- RAG knowledge base of Cyprus property regulations (OpenAI embeddings, Convex vector search) with replies in Greek, English, Russian, and Arabic. Signed WhatsApp Cloud API webhook, debouncing of rapid messages, per-message delivery tracking, and email alerts to the agent.
- Real-time agent dashboard with lead threads, viewing approvals, AI-assisted listing intake from pasted text, and a playground that runs the full pipeline. Next.js 16, React 19, TypeScript, Convex, Clerk, Vercel.

rag-from-scratch — May 2026

- RAG pipeline built from primitives in Python, with no framework or vector database: token-based chunking with overlap (tiktoken), OpenAI embeddings, float32 vectors in SQLite, vectorized cosine-similarity retrieval in NumPy, and grounded generation that declines when the context lacks the answer.

ProfitScan — Dec 2025 – present

- SaaS profitability-analysis tool that ingests four financial files, merges them, allocates shared expenses with configurable rules, and reports net profit per product, customer, and region. Next.js 16, TypeScript, TanStack Query/Table; FastAPI with pandas and async SQLAlchemy; PostgreSQL; Clerk; Cloudflare R2.
- Live at profitscan.app on Vercel and Railway, with rate limiting and server-side pagination.

Stormchaser — Nov 2025 – present

- Quantitative weather prediction-market trading system for Kalshi. Python pipelines store forecasts and market snapshots in PostgreSQL every 15 minutes; ensemble forecasting (NWS, GFS, ECMWF) with per-city bias correction and Student-t probability distributions; automated Telegram alerts. Runs on a self-managed Hetzner VPS; 73% paper-trading success rate over the validation period.

Education

Frederick University, BSc in Computer Science – Limassol, Cyprus — Sept 2020 – June 2024

- GPA: 9.3 / 10

Skills

AI & Backend: LLM APIs (Anthropic, OpenAI), Vercel AI SDK, tool calling, RAG pipelines, embeddings, vector search, agentic workflows, Python, FastAPI, Node.js, Convex, pandas

Frontend: TypeScript, React 19, Next.js, Tailwind CSS, shadcn/ui, TanStack Query / Table

Infrastructure & Tools: PostgreSQL, Vercel, Cloudflare, Railway, Hetzner VPS, Docker, Linux, Stripe, Clerk, Git
